Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Chicken Coccidia Vaccine competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Chicken coccidia vaccine is used to prevent and control coccidiosis, a parasitic disease caused by the coccidia parasite in poultry. Coccidiosis is a common disease in chickens that can severely affect their growth, reduce immunity, and even lead to death in extreme cases. The vaccine stimulates the immune system of chickens, enabling them to effectively combat future infections. The most common forms of chicken coccidia vaccines are oral and injectable, widely used in commercial poultry farming and avian protection programs. The domestic consumption of poultry coccidiosis vaccine exceeds 2.5 billion doses per year, accounting for more than 1/6 of the total output. Each dose is worth 0.05-0.08 yuan, and 2.5 billion doses correspond to sales of more than 150 million yuan. The Chinese market accounts for about 24% of the global market, which exceeds 700 million yuan. The net profit margin of coccidiosis vaccine is 36%, and the gross profit margin is 55-65%. In the next five years, the chicken coccidiosis vaccine market is expected to continue to grow, with an average annual compound growth rate (CAGR) of more than 6.1%. This growth momentum is due to a number of factors, including the increase in demand for high-efficiency vaccines, innovative progress in industry technology, and policy promotion and the increasing attention of the breeding industry to reduce the use of antibiotics. The United States and China are the main consumer markets, especially with the gradual expansion of breeding scale and the promotion of antibiotic substitution policies, the demand for coccidiosis vaccine continues to grow. In terms of vaccine types, quadrivalent vaccines have gradually replaced trivalent vaccines and become the mainstream of the market. Domestic companies such as Foshan Zhengdian, Qilu Qingda, Tianjin Heliant and Xi'an

Skeda occupy an important position in the market, and their vaccine products have been widely used in large breeding companies. Globally, Merck is an important international brand, and its coccidia vaccine has advantages in covering the types of worms, although the promotion in the domestic market is restricted by factors such as price, registration and clinical pathways. Quadrivalent vaccines are gradually becoming mainstream because they target more types of coccidia, and are expected to further replace traditional trivalent vaccines in the future. The Canon Chicken Coccidia Quadrivalent Live Vaccine produced by Canon Bio contains four types of coccidia oocysts: tender, toxic, giant and acervularis Eimeria. It is a weak strain vaccine. Immunity begins to develop 14 days after vaccination, and immunity can last until the end of the breeding period. The breeder chicken coccidia live vaccine produced by Merck contains giant, acervularis, tender, displaced, toxic, Brucella, precocious and Harvey Eimeria, which is a strong strain vaccine.

The global Chicken Coccidia Vaccine market size was estimated at USD 121.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
