Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Chicken Thigh Deboning Machine competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Chicken Thigh Deboning Machine production reached approximately 10340 units, with an average global market price of around K US\$ 37 per unit. The Chicken Thigh Deboning Machine is a high-precision food processing equipment specifically designed to automatically separate the thigh bone (femur) from the surrounding meat. It employs sophisticated mechanisms, such as contouring clamps, positioning pins, and cutting elements, to accurately grasp and secure the chicken thigh. Through a clever mechanical motion, it then cleanly separates the bone from the attached meat. The primary objectives are to maximize meat yield, maintain the integrity and appearance of the deboned product, and meet the demands of high-volume, high-hygiene production, making it a key asset in adding value within the further poultry processing industry. The gross profit margin of the Chicken Thigh Deboning Machine is about 30% -45%, and the single line production capacity is about 300 units. In the manufacturing cost of chicken thigh bone removal machine, high-precision mechanical components (such as customized fixtures, special steel cutting tools, precision guide rails and bearings) and control systems (servo motors, PLC, human-machine interface) account for the highest proportion, about 60% -75%; R&D and engineering design (process development for different raw materials) account for about 15% -20%; The labor and manufacturing costs for precision machining, assembly, and debugging account for approximately 10% -15%; The core of its cost lies in the highly integrated added value of mechanical design, motion control technology, and food technology. On the upstream side, the industry consumes high specification stainless steel, special alloy steel, precision transmission components, and industrial

automation control systems. The downstream consumption is directly related to the global production of boneless poultry meat, and a high-speed boneless machine can process millions of chicken thighs annually. The downstream customers are mainly large poultry processing enterprises, prefabricated vegetable manufacturers, and central kitchens, whose equipment investment is driven by the strong demand for bone and meat products in the end market, labor shortages, and the urgent need to improve production rates and product consistency.

The global Chicken Thigh Deboning Machine market size was estimated at USD 383.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
