Abstracts

Chimeric antigen receptor (CAR) T-cell therapy is a way to get immune cells called T cells (a type of white blood cell) to fight cancer by changing them in the lab so they can find and destroy cancer cells. CAR T-cell therapy is also sometimes talked about as a type of cell-based gene therapy, because it involves altering the genes inside T cells to help them attack the cancer. The CAR T-cell-based drug market is driven by the growing demand for innovative and targeted cancer therapies. Chimeric Antigen Receptor (CAR) T-cell therapy is a revolutionary approach that involves genetically modifying a patient's T cells to recognize and attack cancer cells. The success of CAR T-cell therapies in treating certain types of blood cancers, such as leukemia and lymphoma, has fueled market growth and encouraged research into expanding the application of CAR T-cell therapy to other solid tumor malignancies. However, the market also faces challenges, including the high cost of CAR T-cell therapy and the complexity of the manufacturing process, which may limit patient access. Additionally, the potential for severe side effects and the need for patient selection and management pose regulatory and clinical challenges. To succeed, companies must focus on advancing research, streamlining the production process, collaborating with healthcare providers to improve patient access and support, and addressing safety and efficacy concerns to establish CAR T-cell-based drugs as a transformative treatment option for cancer patients.

The global Chimeric Antigen Receptor (CAR) T-Cell Therapy market size was estimated at USD 5168.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 29.40% during the forecast period.
