Report Overview

One feature of aluminum electrolytic capacitors is that they can be produced relatively inexpensively and in high volume. They also have a wide range of rated voltages, from approximately 2 to 700V, making them convenient for use in a wide range of applications. They also come in different types: chip type, lead type, snap-in terminal type, and screw-terminal type. The capacitor experiencing the greatest increase in demand is the chip-type aluminum electrolytic capacitor. One reason for this growth is that increasingly smaller substrates are necessitating higher degrees of integration, and the substrate surface mount method is the most suitable way to mount highly miniaturized components. Lead-type capacitors are either hand-soldered to the substrate or they are wave soldered (a method in which the capacitor is provisionally fixed on the substrate with adhesive and then immersed in a bath of liquid solder). Chip-type capacitors, however, are soldered using a reflow method in which solder paste is applied to the connection points on the substrate, the capacitor is mounted on top of this, and the substrate is put through a high-temperature oven. Chip-type capacitors are shaped to make them easier to mount to substrates subjected to the reflow method.
