Report Overview:

Chip on board (COB) Light Emitting Diode (LED) is the latest technology of packaging multi LED into one lighting module. Chip diodes of LED are bonded into the PCB by the manufacturers, making thermal conductivity move towards the circuit board resulting in lower heat emission. LED light source is preferred over traditional lighting due to its longer life span and brightness. But normal LED may cause uncomfortable glare which is further rectified in COB LED. Furthermore chip on board LED lights provide higher intensity along with homogenous luminosity helping in the rise in demand for chip on board LED lights globally. In addition to this advancement in design through innovation along with cost savings by large scale manufacture of COB LED lights further enhances the demand for chip on board LED lights. Application wise global chip on board LED market can be segmented into automotive, illumination and backlighting among others.

Relatively new to the LED market, chip on board (COB) LEDs offer many advantages over the standard options. COB LEDs are basically multiple LED chips (typically nine or more) bonded directly to a substrate by the manufacturer to form a single module. Since the individual LEDs used in a COB are chips and not traditionally packaged, the chips can be mounted such that they take up less space and the highest potential of the LED chips can be obtained. When the COB LED package is energized, it appears more like a lighting panel than multiple individual lights as would be the case when using several SMD LEDs mounted closely together.

The Global Chip-on-Board Light Emitting Diodes (COB LEDs) Market Size was estimated at USD 4554.58 million in 2023 and is projected to reach USD 5663.97

million by 2029, exhibiting a CAGR of 3.70% during the forecast period.
