Abstracts

Chip On Submount (CoS) refers to a semiconductor packaging technique where a bare semiconductor die, such as a laser diode or LED chip, is mounted directly onto a submount—a small, thermally conductive platform typically made of materials like silicon carbide, aluminum nitride, or diamond. The submount serves multiple critical functions: it provides mechanical support, enhances heat dissipation to prevent thermal damage, and often includes electrical interconnects or passive components to optimize performance. This configuration is essential in high-power and high-frequency applications, particularly in photonics and optoelectronics, where efficient thermal management and signal integrity are paramount. By isolating the delicate chip from direct attachment to larger, potentially mismatched substrates, CoS technology improves reliability, longevity, and overall efficiency of the device.

The global Chip On Submount (Cos) market size was estimated at USD 552.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.40% during the forecast period.
