Report Overview

The chip packaging COF substrate is the key to the current screen transformation. The main principle is to put the display driver IC chip into the flexible FPC cable, and then use the characteristics of the FPC itself to fold it to the bottom of the screen. Specifically, through thermocompression bonding, the gold bumps of the IC chip and the inner pins on the flexible substrate circuit will be combined. Since the space occupied by the IC chip is released, generally speaking, the width of the lower frame can be reduced by at least 1.5mm.
