Abstracts

Chiral racemization inhibitors for peptide drugs are chemical additives that effectively suppress racemization of amino acids or peptide segments during the condensation reaction. These inhibitors stabilize chiral centers and prevent the interconversion between D- and L-amino acids, thus enhancing the optical purity of the final product. This is crucial for maintaining the bioactivity of peptide drugs, as changes in chiral structure can affect receptor binding, metabolic stability, and overall efficacy. The use of chiral racemization inhibitors helps optimize the synthesis process, improve yield, and reduce the formation of unwanted byproducts, ultimately enhancing the quality and therapeutic performance of peptide drugs.

The global Chiral Racemization Inhibitors for Peptide Drugs market size was estimated at USD 134.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.90% during the forecast period.
