Abstracts

Chitin Synthesis Inhibitors (CSIs) represent a class of insect growth regulators (IGRs) that disrupt the formation of chitin, a critical structural component of the exoskeleton in arthropods, by inhibiting the enzyme chitin synthase. These compounds specifically target immature stages of insects, such as larvae and nymphs, preventing proper molting and leading to developmental arrest or death. Unlike broad-spectrum insecticides, CSIs exhibit selective toxicity, making them valuable in integrated pest management (IPM) programs due to their reduced impact on non-target organisms, including beneficial insects, mammals, and the environment. Common active ingredients include diflubenzuron, novaluron, and lufenuron, which are utilized across agricultural, horticultural, veterinary, and public health sectors to control pests like beetles, moths, flies, and mosquitoes while minimizing ecological disruption and resistance development.

The global Chitin Synthesis Inhibitor market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.15% during the forecast period.
