## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Chitosan Adsorption Microspheres competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of chitosan adsorption microspheres will reach 392 kg, with an average selling price of US\$173/g. Chitosan adsorption microspheres are spherical microparticles prepared using chitosan (a natural cationic polysaccharide obtained by deacetylation of chitin) as a matrix through methods such as emulsion crosslinking, spray drying, or ion gelation. Their structure typically consists of a porous network with a rich surface rich in reactive functional groups such as amino (-NH<sub>2</sub>) and hydroxyl (-OH) groups. They can efficiently adsorb metal ions (such as Pb<sup>2+</sup> and Cd<sup>2+</sup>), organic pollutants (such as dyes and pesticides), or biomolecules (such as proteins and nucleic acids) through physical adsorption (e.g., electrostatic interactions and hydrogen bonding) or chemical modification (e.g., crosslinking and grafting). This material is biocompatible, degradable, and environmentally friendly, and is widely used in environmental remediation, bioseparation, and drug delivery.

The global Chitosan Adsorption Microspheres market size was estimated at USD 67.82 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
