Report Overview

Chitosan based hydrogel typically refers to a three-dimensional network of chitosan molecules that cross-link to form an insoluble, hydrophilic polymer matrix. Chitosan is derived from chitin, which is a natural polymer found in the shells of crustaceans, such as shrimp, crab, and lobster. Chitosan molecules have many functional groups, such as amino and hydroxyl groups, which allow them to form strong bonds. Chitosan based hydrogels have numerous applications, including biomedical, environmental, and agricultural industries. As hydrogels, they have the ability to absorb and retain large amounts of water, making them useful as wound dressings, drug delivery systems, and tissue engineering scaffolds. They have also been used to remove heavy metals and organic pollutants from wastewater and soil. The properties of chitosan based hydrogels can be modified through chemical crosslinking or blending with other polymers. For example, the incorporation of polyethylene glycol (PEG) into a chitosan hydrogel can enhance the mechanical strength and biocompatibility, while also providing a controlled release of drugs. Overall, chitosan based hydrogels are a versatile and sustainable material with broad applications in various industries.
