Abstracts

A chlor-alkali anode is a crucial component in the chlor-alkali process, which electrolyzes brine (sodium chloride solution) to produce chlorine gas, sodium hydroxide (caustic soda), and hydrogen gas. These anodes are typically made of titanium coated with metal oxides, such as ruthenium oxide or iridium oxide, to enhance their electrochemical activity and durability. During electrolysis, the anode facilitates the oxidation of chloride ions to chlorine gas. The choice of coating materials and anode design is critical for achieving high efficiency, minimizing energy consumption, and ensuring a long operational lifespan in the corrosive environment of the chlor-alkali process. The chlor-alkali anode industry is moving towards more sustainable and efficient technologies. Upstream, there's a focus on developing more durable and cost-effective coating materials, with a reduction in reliance on rare metals. Downstream, the rising demand for chlorine and caustic soda in various industries, including water treatment and chemical manufacturing, is driving innovation. Product specifications are emphasizing energy efficiency, longer lifespan, and reduced environmental impact. The future market size is projected to grow, driven by increasing industrialization and stricter environmental regulations, which necessitate advanced anode technologies for cleaner and more efficient chlor-alkali production.

The global Chlor Alkali Anode market size was estimated at USD 129.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
