## Abstracts

Chloride Guard Catalysts are specialized chemical formulations used primarily in the petroleum refining industry, particularly in catalytic reforming and isomerization processes, to neutralize and manage the adverse effects of chloride compounds that can accumulate in reactor systems. These catalysts function by chemically adsorbing or reacting with chlorides—often introduced through feedstock impurities or as a byproduct of catalyst regeneration—thereby protecting the primary platinum-based catalysts from deactivation, corrosion, and loss of selectivity. By maintaining optimal catalytic performance, they enhance operational efficiency, extend catalyst lifespan, improve product yields, and reduce unplanned shutdowns, directly impacting refinery economics and reliability.

The global Chloride Guard Catalysts market size was estimated at USD 140.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
