Abstracts

Chlorobutyl rubber is a chlorinated copolymer of isobutylene and isoprene (CIIR) with improved compression set and better resistance to heat, ozone and flex fatigue compared to regular butyl. Chlorobutyl rubber offers a low permeability to gases and moisture, low glass transition temperature, low compression set and a wide vulcanization versatility. Chlorobutyl rubber primary application in tire inner liners and tubes for automobiles provides a strong growth opportunity. With the rising demand for vehicles, especially electric vehicles (EVs), the need for more efficient and durable tires is growing. Chlorobutyl rubber's excellent air retention, heat resistance, and impermeability make it ideal for this use. Moreover, chlorobutyl rubber is widely used in pharmaceutical closures (e.g., vial stoppers, seals) and medical products. The global expansion of healthcare infrastructure and growing demand for pharmaceutical products, especially in developing markets, offer significant growth potential. There are mainly two producers of chlorobutyl rubber in China. Chlorobutyl rubber belongs to the halobutyl rubber family. In August 2018, five-year anti-dumping duties on halobutyl rubber from the United States, the EU and Singapore were imposed by China. In Sep, 2024, China will continue to impose anti-dumping duties on halobutyl rubber originating from the United States, the European Union (EU), the United Kingdom (UK) and Singapore. Duties ranging from 23.1 to 75.5 percent will be levied toward the related companies for a five-year period, according to the ministry.

The global Chlorobutyl Rubber market size was estimated at USD 1608.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
