Abstracts

Chlorosilane intermediates are a class of organosilicon compounds primarily derived from the reaction of silicon metal with alkyl or aryl chlorides, serving as essential precursors in the production of silicones, silanes, and siloxanes. These intermediates, such as methylchlorosilanes, are critical building blocks used to manufacture a wide range of end products, including sealants, adhesives, lubricants, resins, and coatings, and are also employed in the semiconductor industry for silicon deposition processes. The properties and reactivity of chlorosilanes?such as their ability to undergo hydrolysis, condensation, and other chemical transformations?make them fundamental to the synthesis of high-performance materials with tailored thermal, mechanical, and hydrophobic characteristics.
