Abstracts

Chlorpheniramine Maleate is a first-generation alkylamine antihistamine used primarily to relieve symptoms of allergic conditions such as hay fever, urticaria, conjunctivitis, and reactions to insect bites or stings; it acts by competitively antagonizing histamine at H1 receptors, thereby reducing allergic symptoms like sneezing, itching, watery eyes, and runny nose. Due to its sedative properties and relatively low cost, it remains widely available in both prescription and over-the-counter formulations, often included in multi-symptom cold and allergy remedies, though its use has somewhat declined with the advent of less sedating second-generation antihistamines in many developed markets.

The global Chlorpheniramine Maleate market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 2.80% during the forecast period.
