Report Overview

Chopped and milled fiberglass are two forms of fiberglass material that are commonly used in various industries for their strength, durability, and versatility.

Chopped fiberglass: Chopped fiberglass consists of short lengths of fiberglass strands or rovings that have been cut into specified lengths. These strands are typically bound together using a binder material, such as an emulsion or a powder, to form a loose fiber mat or a preformed shape. Chopped fiberglass is often used as a reinforcing material in composite structures, where it provides strength and stiffness to the finished product. It is commonly used in applications such as automotive parts, boat hulls, pipes, and construction materials.

Milled fiberglass: Milled fiberglass, also known as fiberglass powder or fiberglass filler, is produced by grinding or milling continuous fiberglass strands into fine particles. The resulting fiberglass powder has a fine texture and can be mixed with various resins, polymers, or other materials to enhance their mechanical properties. Milled fiberglass is often used as a filler or additive in composites, coatings, adhesives, and plastics to improve strength, impact resistance, dimensional stability, and surface finish. It can also be used in applications such as lightweight panels, insulation materials, and corrosion-resistant coatings.
