Report Overview

Chromic gut sutures are absorbable surgical sutures made from purified collagen derived from sheep or bovine intestines, treated with chromium salts to enhance their tensile strength and delay absorption time compared to plain gut sutures. They are commonly used in surgeries where wound support is needed for longer than plain gut sutures but where non-absorbable sutures are unnecessary, such as in soft tissue approximation, gynecological, and ophthalmic procedures. The chromic treatment slows enzymatic degradation, allowing the suture to maintain strength for approximately 14?21 days, with complete absorption typically occurring within 90 days. Its natural composition reduces tissue reaction compared to synthetic absorbable sutures, though it may still provoke a mild inflammatory response. Chromic gut sutures remain a cost-effective and versatile option, particularly in settings requiring moderate wound support without long-term presence.

The global Chromic Gut Sutures market size was estimated at USD 350.39 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
