Abstracts

Chromium sputtering targets are high-purity metallic materials, typically in disc, rectangular, or cylindrical forms, used in physical vapor deposition (PVD) processes?most commonly magnetron sputtering?to deposit thin, uniform layers of chromium onto various substrates. These targets are manufactured with precise chemical compositions, microstructural homogeneity, and controlled grain sizes to ensure consistent deposition rates, film adhesion, and performance in applications ranging from decorative and wear-resistant coatings to functional layers in electronics, optics, and aerospace components. The quality and specifications of chromium sputtering targets, such as purity levels (often 99.9% to 99.999%), density, and bonding integrity, are critical factors influencing their suitability for specific industrial and research uses.

The global Chromium Sputtering Target market size was estimated at USD 146.85 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
