Abstracts

Chromoblastomycosis is a fungal infection caused by species such as *Fonsecaea pedrosoi*, *Cladophialophora carrionii*, *Phialophora verrucosa*, *Fonsecaea compacta*, *Rhinocladiella aquaspersa*, *Chaetomium funicola* and others. This disease mostly affects the skin and the subcutaneous tissues. Globally, there is about a million type of fungal species, yet nearly 300 are capable of causing infections or disease in humans. Most of these cases are seen in people with compromised immune systems and can occur almost in any part of the body. A type of fungal infection known as systemic mycosis is affecting the internal organs of the body. During this, fungal infection can spread and affect other organs of the body. The rising cases of immunological diseases is a reason for increased probability of systemic mycosis. Thus, the developing novel treatment for chromoblastomycosis with fewer side effects is the primary objective of manufacturing companies.

The global Chromoblastomycosis Treatment market size was estimated at USD 888.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.40% during the forecast period.
