Abstracts

Photovoltaic cells, commonly referred to as solar cells, are semiconductor devices that convert sunlight directly into electricity through the photovoltaic effect, with cigs photovoltaic cells specifically utilizing a thin-film technology composed of copper indium gallium selenide (CIGS) as the light-absorbing layer. This technology is characterized by its flexibility, lightweight properties, and relatively high efficiency compared to other thin-film alternatives, making it suitable for applications ranging from building-integrated photovoltaics (BIPV) and portable electronics to utility-scale solar farms. The global market for cigs photovoltaic cells has experienced moderate growth, driven by increasing demand for renewable energy sources, advancements in manufacturing processes that reduce production costs, and supportive government policies and incentives promoting solar energy adoption. Key market players are focused on enhancing cell efficiency, improving durability, and expanding production capacity to compete with dominant crystalline silicon technologies, though challenges such as material scarcity (particularly indium), competition from perovskite and other emerging solar technologies, and fluctuations in raw material prices continue to influence market dynamics. Regional analysis shows strong growth in Asia-Pacific, led by China and Japan, due to robust manufacturing capabilities and substantial investments in solar infrastructure, while North America and Europe also contribute significantly, supported by sustainability initiatives and increasing residential and commercial solar installations.

The global Cigs Photovoltaic Cells market size was estimated at USD 272.65 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.50% during the forecast period.
