Report Overview

The cinema xenon lamp used in movie screenings is a highly specialized device. Cinema xenons work by generating an electric arc between two points. Xenon emits light when it conducts electricity. Xenon is a very dense gas. Naturally occurring it consists of 9 stable isotopes and it conducts electricity very well. Xenon gas provides a very bright and very even glow when electricity arcs through it. This is especially useful in a cinema setting. Without a bright enough light, you will not be able to project the image well onto the screen. Without an even light, the image could appear to flicker or go dim. This is why Xenon works so well for lighting a cinema projector.
