Report Overview

A circular flanging machine is a type of machine used in metalworking processes to create a flange on circular or cylindrical objects. A flange is a raised edge or rim that is typically used to strengthen or attach one object to another.

The circular flanging machine consists of a rotating mandrel or spindle that holds the circular object in place. The machine has a set of flanging tools or dies that are pressed against the edge of the object to create the flange. The flanging tools can be adjusted to create different sizes and shapes of flanges.

The machine operates by rotating the mandrel while simultaneously pressing the flanging tools against the edge of the object. This process deforms the material and creates the desired flange shape. The machine may also have additional features such as automatic feeding and cutting mechanisms to streamline the flanging process.

Circular flanging machines are commonly used in industries such as automotive, aerospace, and HVAC (heating, ventilation, and air conditioning) for applications such as forming flanges on pipes, cylinders, and other circular components.
