Abstracts

A circular stacker reclaimer is a continuous bulk material handling machine used in large-scale industrial operations such as ports, power plants, and mining facilities to stack and reclaim materials like coal, iron ore, limestone, or grain in circular stockyards. Unlike linear systems, it operates on a circular rail track, rotating around a central pivot point to stack material in concentric rings and reclaim it using a slewing or radial boom equipped with a bucket wheel or scraper. The machine combines stacking and reclaiming functions into a single unit, optimizing space utilization, reducing land footprint, and offering high operational efficiency with minimal dust generation and material degradation. Its design allows for fully automated operation, integrating with yard management systems for precise inventory control and seamless material flow in processes such as blending, storage, and transportation.

The global Circular Stacker Reclaimer market size was estimated at USD 350.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
