## Abstracts

The circulating cooling water treatment dosing system is an automated equipment used to maintain the water quality of industrial cooling water systems. It is widely used in the fields of electricity, chemical industry, metallurgy and air conditioning. The system effectively controls scale, corrosion, microbial growth and other problems by accurately adding chemical agents to the circulating water, ensuring the efficient and stable operation of the cooling system. The core components of the dosing system include agent storage tanks, metering pumps, mixing devices and control systems. Agents such as scale inhibitors, corrosion inhibitors and bactericides are stored in special containers and quantitatively injected into the circulating water pipeline as needed through precision metering pumps. The mixing device ensures that the agent and water are fully and evenly mixed to improve the treatment effect.

The global Circulating Cooling Water Treatment Dosing System market size was estimated at USD 2426.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
