Report Overview

Circulating tumor cells (CTCs) are tumor cells that detach from the primary tumor and travel in the bloodstream, spreading from the original tumor to other locations, leading to cancer metastasis. These cells exist in peripheral blood of cancer patients and detection of CTCs can help to determine the process of metastasis. In contrast with other blood cells, the number of CTCs is very rare in blood which makes them difficult to detect.

Cancer stem cells (CSCs) are cancer cells that have all the classical properties of normal stem cells. Specifically, they are able to both give rise to more copies of themselves and to give rise to all cell types found in the cancer.
