## Abstracts

A circulating vertical conveyor is a continuous material handling device, mainly used for vertical transportation of materials in a limited space. It lifts and lowers materials through a circulating chain, belt or bucket container, achieving efficient vertical transportation. A circulating vertical conveyor usually consists of a closed circulation system, which includes a drive device, a conveying chain or belt, and a container carrying materials. When the drive device is started, the chain or belt drives the container to circulate, and the material can be transported from one horizontal plane to another without interrupting the conveying process.
