## Abstracts

Circulating water coolers, also known as recirculating chillers or cooling systems, are devices designed to remove heat from equipment or processes by circulating a coolant—typically water or a water-glycol mixture—through a closed-loop system. These systems consist of a refrigeration unit, a pump, a reservoir, and heat exchangers, working together to maintain precise temperature control in applications where consistent cooling is critical. They are distinguished from single-pass cooling systems by their ability to reuse the same coolant repeatedly, enhancing efficiency and reducing water consumption. Commonly used in industrial, medical, laboratory, and high-tech environments, these coolers prevent overheating in equipment such as lasers, MRI machines, plastic injection molding machines, and analytical instruments, ensuring operational stability and prolonging equipment lifespan.

The global Circulating Water Coolers market size was estimated at USD 1050.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.75% during the forecast period.
