Abstracts

Circulator bath fluid, also known as circulator bath coolant or circulator bath liquid, is a type of liquid used in circulator baths or water baths for temperature control purposes. These baths are commonly used in laboratories, research facilities, and industrial settings to maintain a constant temperature for various applications such as sample incubation, chemical reactions, and material testing.Circulator bath fluids are designed to have specific thermal properties, such as high thermal conductivity and low viscosity, to efficiently transfer heat and maintain temperature stability within the bath. They are typically formulated with a mixture of water, glycols (such as ethylene glycol or propylene glycol), and other additives to enhance their thermal properties and prevent bacterial growth.The choice of circulator bath fluid depends on the desired temperature range, the specific application, and the equipment being used. Different fluids have different temperature ranges and properties, such as low-temperature fluids for cryogenic applications or high-temperature fluids for elevated temperature applications.

The global Circulator Bath Fluid market size was estimated at USD 12100.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
