Report Overview

Clark Electrode is a silver-platinum electrochemical cell whose electrodes are covered by non-conductive membranes. They are used to measure gaseous or solubilized oxygen in the liquid. Clark Electrodes rely on the limited permeability to oxygen of non-conductive membranes, which reduces oxygen loss at the electrodes and allows the quantification in circulating blood. The Clark Electrodes are one of the inventions that become the basis of modern blood gas analyzers, which quantify the blood pH, oxygen, and carbon dioxide level in vitro and in vivo. The same principle used for Clark oxygen electrodes has been adapted to build other gas measuring devices and biochemical sensors for medical, agricultural, and other industrial applications.
