Abstracts

The Clark oxygen electrode is a specialized electrochemical sensor designed for the precise measurement of dissolved oxygen concentration in aqueous solutions, operating on the principle of polarographic reduction where oxygen diffuses through a gas-permeable membrane and is reduced at a cathode, generating an electrical current proportional to oxygen partial pressure. Characterized by its high sensitivity, accuracy, and repeatability, it is widely utilized across biomedical research, clinical diagnostics, environmental monitoring, and industrial fermentation processes to assess oxygen levels in blood samples, cell cultures, wastewater, and bioreactors. The device typically consists of a platinum cathode and a silver/silver chloride anode immersed in an electrolyte solution, enclosed by an oxygen-permeable membrane that ensures selectivity and stability while minimizing interference from other dissolved substances. Its applications extend to quality control in food and beverage production, aquatic ecosystem studies, and respiratory physiology, underscoring its role as an indispensable tool in both laboratory and field settings where reliable, real-time oxygen quantification is critical.

The global Clark Oxygen Electrode market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
