Report Overview

A Class D audio power amplifier chip is an electronic amplifier that uses transistors (usually MOSFETs) as electronic switches instead of linear gainers, as other amplifiers do. They generate a pulse-train output by rapidly switching between supply rails using pulse-width modulation, pulse-density modulation, or related techniques. This passes through a simple low-pass filter, which blocks high frequency pulses, and provides analog output current and voltage. Since transistors are always fully on or fully off, they dissipate very little power and can be more than 90 percent efficient.

The global Class D Audio Power Amplifier Chip market size was estimated at USD 2185.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
