Abstracts

The clavicle compression plate is an orthopedic implant specifically designed for the surgical fixation and stabilization of clavicle fractures, typically made from biocompatible materials such as titanium or stainless steel, featuring a low-profile, anatomically contoured shape to match the S-curve of the clavicle bone, and employing screw holes that allow for dynamic compression to promote optimal bone alignment and healing. These plates are utilized in open reduction and internal fixation (ORIF) procedures to restore shoulder girdle function, reduce fracture displacement, and enable early mobilization, with variations including pre-contoured designs for midshaft, lateral, or medial fractures, locking and non-locking options for varying bone quality, and specialized plates for comminuted or complex fracture patterns.

The global Clavicle Compression Plate market size was estimated at USD 120.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.25% during the forecast period.
