## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Clavicle Model competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global clavicle model production reached approximately 1.75 M units, with an average global market price of around US\$ 27.7 per unit. The clavicle model is an anatomically realistic replica of the human shoulder girdle. It is commonly used in medical education, orthopedic surgery planning, sports injury research, and forensic medicine. The model faithfully reproduces the clavicle's length, curvature, articular surface morphology, and bony structure, helping users gain a deeper understanding of the shoulder joint mechanism and related pathologies.

**Core Structural Features** High-strength resin, medical-grade PVC, or 3D-printed composite materials are commonly used to ensure durability and morphological accuracy. Simulated bone texture and natural bone color are available in transparent or translucent versions for visualization of the medullary cavity and internal structures. Some models can be combined with the scapula or sternum to demonstrate the spatial relationship between the acromioclavicular and sternoclavicular joints.

**Model Selection Recommendations** Basic teaching models offer affordable, durable design, perfect for classroom practice and observation. High-precision research models offer detailed surface details, facilitating the study of articular surfaces, fracture lines, and healing status. Detachable modular models can be combined with the scapula and humerus to demonstrate the connection between the shoulder girdle and upper limb bones. 3D-printed custom models are customized based on patient imaging data to reproduce individual bone shape and pathological characteristics.

**Growth Drivers** Demand for orthopedic and sports medicine education continues to expand. Personalized surgical planning and preoperative simulation are becoming increasingly common. 3D printing technology facilitates customization and

rapid production. Medical education infrastructure in emerging markets continues to improve. Regional Market Structure (2024) North America accounts for 37%, driven by mature orthopedic education and sports rehabilitation research systems and high procurement volumes from hospitals and medical schools. Europe accounts for 31%, primarily due to a high degree of standardization in medical education and stable research investment. The Asia-Pacific region accounts for 26%, with rapid growth in demand for medical students and orthopedic training in countries like China and India. Other regions account for 6%, driven by the gradual establishment of anatomy and orthopedic education systems in emerging markets. Application Industry Structure (2024) Medical education accounts for 53%, orthopedic surgery and sports medicine training account for 22%, research and laboratory research accounts for 18%, and forensic medicine and identification account for 7%.

The global Clavicle Model market size was estimated at USD 48.52 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.40% during the forecast period.
