Abstracts

The clavicle plating system is a specialized orthopedic implant device designed for the surgical fixation of clavicle (collarbone) fractures, typically composed of titanium or stainless-steel plates contoured to match the anatomical shape of the clavicle, along with corresponding screws for secure attachment to bone fragments. These systems facilitate anatomical reduction, provide rigid stabilization to promote bone healing, and allow early mobilization, with variations including pre-contoured plates for specific fracture patterns (such as midshaft, lateral, or medial fractures), locking screw options for enhanced stability in osteoporotic bone, and low-profile designs to minimize soft tissue irritation. The technology represents a shift from non-operative management or traditional pinning methods toward more predictable fracture alignment and functional recovery, though it requires precise surgical technique to avoid complications such as implant prominence or neurovascular injury.

The global Clavicle Plating System market size was estimated at USD 250.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.75% during the forecast period.
