Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Cleanroom FFU and Filter competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A fan filter unit (FFU) is a type of air filtering equipment. It is used to supply purified air to cleanrooms or microenvironments by filtering out harmful airborne particles from the recirculating air. The units are installed within the system's ceiling or floor grid. Large cleanrooms require a proportionally large number of FFUs, which in some cases may range from several hundred to several thousand. Cleanroom Air Filters are designed for use in controlled critical environments such as hospitals and in microelectronic, pharmaceutical and biotech facilities. A cleanroom uses air filters that are much more efficient than those used in offices. With the continued rapid development of the global electronics and semiconductor industries, the demand for clean manufacturing environments is also increasing. In recent years, with the widespread application of cutting-edge technologies such as 5G communications, artificial intelligence, autonomous driving, electric vehicles, and the Internet of Things, the semiconductor industry chain has shown explosive growth. The manufacture of advanced process chips has extremely high requirements for environmental cleanliness, temperature and humidity control, and the management of particulate matter and chemical pollutants. Especially in wafer manufacturing, packaging testing, display devices, and high-end electronic assembly, clean rooms have become an indispensable infrastructure. Against this background, the Cleanroom FFU (fan filter unit) and high-efficiency filters (such as HEPA/ULPA) market has ushered in broad development space. As the core equipment of the cleanroom air circulation and filtration system, FFU can provide local laminar flow, stable wind speed and continuous filtration performance, and is a key component of the construction of electronic and semiconductor cleanrooms. High-performance filters can

effectively intercept micron or even submicron particles to ensure the extremely high cleanliness level of the production environment (such as ISO 4-6). As many countries around the world accelerate the construction of local semiconductor production capacity, especially in mainland China, the United States, South Korea, Japan, Europe and other places, the demand for clean room equipment and its core filtration system continues to rise. At the same time, the concept of green manufacturing also promotes the development of FFU systems in the direction of low energy consumption, high static pressure and intelligence. It can be foreseen that in the next few years, the Cleanroom FFU and Filter market will keep up with the expansion of the electronics and semiconductor industries, continue to release growth potential, and become an important growth engine in the field of clean technology.

The global Cleanroom FFU and Filter market size was estimated at USD 1315.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
