Report Overview:

Clear aligners are orthodontic devices that are a transparent, plastic form of dental braces used to adjust teeth. Clear-aligner treatment involves an orthodontist or dentist, or with home-based systems, the person themselves, taking a mold of the patient's teeth, which is used to create a digital tooth scan. The computerized model suggests stages between the current and desired teeth positions, and aligners are created for each stage. Each aligner is worn for 22 hours a day for one or two weeks. These slowly move the teeth into the position agreed between the orthodontist or dentist and the patient. The average treatment time is 13.5 months.

The Global Clear Aligners Market Size was estimated at USD 5836.28 million in 2023 and is projected to reach USD 7427.46 million by 2029, exhibiting a CAGR of 4.10% during the forecast period.
