## Abstracts

Carrier tape is a type of strip product applied in the field of electronic packaging. It has a specific thickness and is evenly distributed with holes (also known as pockets) for placing electronic components and indexing holes for positioning along its length. Carrier tape can be categorized by material into paper carrier tape and plastic carrier tape. Paper tape has the advantages of low cost and easy handling, making it suitable for packaging chip components with a thickness not exceeding 1mm, and it is mainly used for passive components such as RCL. Plastic carrier tape is used for thicker components, suitable for active components like integrated circuits, semiconductor products, and thicker passive components. Plastic carrier tape products can be further divided into black plastic carrier tape and transparent plastic carrier tape. Black carrier tape is mainly used in high-end electronic components such as the semiconductor market due to its good electrical conductivity, while transparent plastic carrier tape is mainly used in the mid to low-end market.

The global Clear Carrier Tape market size was estimated at USD 532.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.00% during the forecast period.
