Report Overview

Clock jitter cleaners and synchronizers are circuits used to remove clock jitter and synchronize system clocks. Clock jitter refers to small changes in the clock signal during transmission, which may be caused by the capacitance, inductance, and resistance of the signal transmission line. These small changes can cause different parts of the system to operate at different times, resulting in system errors or unpredictable behavior. The clock jitter cleaner can eliminate clock jitter by filtering or buffering the clock signal to keep it stable during transmission. It can improve system reliability and performance by eliminating clock jitter to ensure that the operations of various components in the system always occur at the same time. A synchronizer is a circuit that ensures that the clock signals of different components are synchronized. It usually uses latches or other synchronous circuits to keep the clock signals of the different components in sync and ensure they operate at the same instant. Synchronizers are often used in multiprocessor systems or distributed systems to ensure that the operations of different processors in the system are coordinated.

The global Clock Jitter Cleaners And Synchronizers market size was estimated at USD 420.85 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.65% during the forecast period.
