### Report Overview

Clock synchronizers are designed for wired networking applications, providing the clock redundancy functionality needed to maximize system uptime. Technology supports clock synchronization with common standards, including 1 pulse per second (PPS) output signal from a GPS receiver. GPS signals are broadly available and utilize an extremely stable atomic clock as its time base, but they are often noisy. Systems rely on the IEEE1588 timing protocol to establish synchronous communications across the wired network, including synchronous Ethernet and synchronous digital hierarchy (SDH) to optical transport network (OTN) mapping/demapping. The IEEE1588 protocol has emerged as the preferred method for Clock synchronizing systems throughout both computer networks and local area networks (LAN).

The global Clock Synchronizers market size was estimated at USD 2201.60 million in 2023 and is projected to reach USD 5023.81 million by 2032, exhibiting a CAGR of 9.60% during the forecast period.
