Abstracts

The closed needleless infusion connector is a critical component used in needle-free infusion systems. Its primary function is to maintain a sealed state of the infusion channel after the infusion set or syringe is disconnected, preventing the entry of air or contaminants into the infusion system. Using needle-free injection technology, the closed needleless infusion connector eliminates the need for repeated needle punctures, thereby reducing the risk of healthcare workers being exposed to blood or other potential sources of infection. It is particularly suitable for patients undergoing long-term infusion or intravenous therapy. Its design effectively enhances the safety and hygiene of the infusion process. The closed needleless infusion connector is an advanced version of the needle-free infusion system, designed to maintain a completely sealed function, further enhancing safety and hygiene during medical procedures. Unlike traditional open systems, the closed needleless infusion connector ensures that the infusion pathway remains completely closed during use, preventing the entry of air or pathogens, which significantly reduces the risk of infections. Additionally, the design of these connectors offers ease of use while minimizing risks for healthcare personnel during operations. Currently, closed needleless infusion connectors are widely used in more advanced healthcare markets, especially for patients requiring long-term infusion or those undergoing high-risk procedures. As global awareness of medical safety increases, more hospitals and clinics are gradually adopting this technology. Future trends primarily focus on two areas: First, with continuous medical innovation, closed needleless infusion connectors are expected to become a broader healthcare standard; second, as the demand for patient safety and nursing efficiency grows, ongoing advancements in technology will likely lead to multifunctional connectors that can meet diverse clinical needs. However, the widespread adoption of closed needleless infusion connectors also faces challenges. Initially, the innovation and implementation of the technology require significant financial investment, particularly in resource-limited

regions, where the upfront costs may become an obstacle to adoption. Moreover, using this connector effectively requires healthcare personnel to possess the necessary skills and knowledge, increasing the need for training and potentially adding to hospital management costs. Additionally, while demand for high-safety infusion devices is rising, the entrenched usage of traditional infusion systems may slow the acceptance of new technologies.

The global Close Needleless Infusion Connector market size was estimated at USD 1153.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
