Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Closed-Cell Cellulose Foams competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Closed-Cell Cellulose Foams production reached approximately 150 kilotons, with an average global market price of around US\$ 4,200 per ton. Closed-Cell Cellulose Foams are lightweight, porous materials made from regenerated or modified cellulose that form a structure of sealed, gas-filled cells surrounded by thin cell walls, preventing fluid or air from passing through. Unlike open-cell foams, their closed-cell architecture provides low water absorption, excellent thermal insulation, buoyancy, and structural rigidity while maintaining biodegradability and renewability due to their cellulose origin. These foams are often produced through physical or chemical foaming processes combined with crosslinking to stabilize the structure, making them useful in packaging, thermal and acoustic insulation, cushioning, and eco-friendly alternatives to petroleum-based foams.

The global Closed-Cell Cellulose Foams market size was estimated at USD 620.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
