Report Overview

The closed-loop current sensor is a current measurement device designed with the Hall chip as the core sensitive element, applying the Hall effect principle and adopting the closed-loop working principle. When a current flows through a conductor, a magnetic field is generated around the conductor. The magnitude of the magnetic field is proportional to the current flowing through the wire. This magnetic field can be collected by soft magnetic materials and then detected by the Hall chip. Due to the change of the magnetic field Has a good linear relationship with the output voltage signal of the Hall device, so the output signal measured by the Hall device can directly reflect the current in the conductor
