Report Overview

Magnetic Resonance Imaging Systems uses a non-invasive imaging technology to investigate anatomy and function of the body in both aspects such as health and disease without the use of damaging ionizing radiation. It can be used in detection, diagnosis, and treatment monitoring of various chronic diseases. It is based on technology that excites and detects the changes occurred in protons found in the tissue fluid. It can differentiate between white matter and grey matter in the brain. It is the only imaging modality in demand as it does not use x-rays when frequent imaging is required for diagnosis or therapy, especially in the brain. Closed MRI Systems includes a large magnet and radio wave that sends signals and receives signals from the body.

The global Closed Magnetic Resonance Imaging (MRI) Systems market size was estimated at USD 3210 million in 2023 and is projected to reach USD 4608.52 million by 2032, exhibiting a CAGR of 4.10% during the forecast period.
