Abstracts

Magnetic Resonance Imaging Systems uses a non-invasive imaging technology to investigate anatomy and function of the body in both aspects such as health and disease without the use of damaging ionizing radiation. It can be used in detection, diagnosis, and treatment monitoring of various chronic diseases. It is based on technology that excites and detects the changes occurred in protons found in the tissue fluid. It can differentiate between white matter and grey matter in the brain. It is the only imaging modality in demand as it does not use x-rays when frequent imaging is required for diagnosis or therapy, especially in the brain. Closed MRI Systems includes a large magnet and radio wave that sends signals and receives signals from the body. The growth of the MRI Systems Market is driven by increase in geriatric population and rise in incidence of diseases such as brain tumor, breast cancer, prostate cancer, scoliosis, and sclerosis. Moreover, technological growth such as superconducting (SC) magnets, open architecture, high-field MRI, and software applications are other factors that contribute toward the growth of the market. However, decline in restitution rates for MRI procedures and scarcity of helium gas deposits are expected to hinder the growth of the market. Conversely, the advantage of MRI in detection of the early molecular and cellular changes in Alzheimer disease provides lucrative opportunities in the growth of the market.

The global Closed Magnetic Resonance Imaging (MRI) Systems market size was estimated at USD 3352.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
