Abstracts

A Cloud Access Security Broker (CASB) Tool is a cybersecurity solution that acts as an intermediary (or 'broker') between an organization's on-premises infrastructure, users, and cloud services, providing visibility, control, and security for cloud-based data and applications. Positioned as a gatekeeper, it monitors and manages all traffic between users and cloud services (such as SaaS platforms like Microsoft 365, AWS, or Google Workspace) to enforce security policies, detect threats, and prevent unauthorized data access or leakage. CASB tools typically offer capabilities like data encryption, user and entity behavior analytics (UEBA), threat detection (e.g., malware scanning), compliance monitoring (against regulations like GDPR or HIPAA), and policy enforcement for activities such as file sharing, data uploads/downloads, and user authentication. By inspecting cloud traffic in real time, CASB solutions help organizations address risks like shadow IT (unauthorized cloud services used by employees), data exposure, and insecure configurations, ensuring that cloud usage aligns with security standards while enabling flexible, modern work environments. Essentially, a CASB tool bridges the gap between traditional on-premises security models and the dynamic, distributed nature of cloud computing, providing centralized control and visibility to protect sensitive data across hybrid and multi-cloud ecosystems.

The global Cloud Access Security Broker Casb Tool market size was estimated at USD 8916.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.40% during the forecast period.
