Abstracts

The Cloud Control Platform of Vehicle and Road Collaborative (also known as a Vehicle-Road Collaborative Cloud Control Platform) is a smart infrastructure system that uses cloud computing, big data, and vehicle-to-everything (V2X) communication to facilitate seamless interaction between vehicles, road infrastructure, and traffic management systems. The platform aims to optimize traffic flow, improve road safety, and enhance the efficiency of autonomous and connected vehicles by providing real-time data exchange and collaborative decision-making. The vehicle-road cooperative cloud control platform industry chain covers the entire chain of "perception-communication-computing-application". Upstream includes roadside perception equipment (cameras, millimeter-wave radar, LiDAR), communication modules (C-V2X OBU/RSU chips, such as Huawei and Qualcomm solutions), high-precision positioning modules, and edge computing hardware suppliers. Midstream is the core platform layer, responsible for building a cloud control infrastructure platform with data fusion, digital twin, collaborative decision-making, and API openness capabilities. Downstream serves government traffic management departments, intelligent connected vehicle testing demonstration zones, autonomous driving operation companies, and mobility service providers, supporting the implementation of scenarios such as traffic light coordination, vulnerable road user warnings, and remote driving. This platform belongs to a software-intensive, highly integrated, and highly customized field, with an overall project gross profit margin generally around 50%. Companies with "city-level data operation + ecosystem integration" capabilities have a stronger long-term competitive advantage. As the core hub of the "vehicle-road-cloud integrated" intelligent connected vehicle system, the vehicle-road cooperative cloud control platform is at a critical stage driven by strong policies, accelerated pilot implementation, and iterative technological architecture. Currently, the industry is led by local governments and jointly built by automakers and

technology companies, initially forming a model of "1 cloud control basic platform + N types of application scenarios" (traffic light coordination, blind spot warning, automatic parking, etc.). Future trends focus on three major directions: First, the architecture will evolve towards a three-level collaborative system of "central cloud + edge cloud + terminal side" to support the large-scale application of L4 autonomous driving; second, it will deeply integrate with urban brains and traffic management, moving from single-point functions to full-domain traffic optimization; and third, the exploration of commercialization paths will accelerate, achieving sustainable operation through data services, V2X value-added services, and insurance linkage. Despite challenges such as inconsistent standards, difficulties in cross-domain interoperability, and long investment return cycles, with the implementation of the "Vehicle-Road-Cloud Integrated China Solution" technology roadmap in 2025, the cloud control platform is moving from a "demonstration model" to a new stage of "large-scale commercial use".

The global Cloud Control Platform of Vehicle and Road Collaborative market size was estimated at USD 1186.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
