Abstracts

A cloud height ceilometer is an instrument that measures the height of the base of clouds above the ground, typically using optical or laser-based technology such as LIDAR (Light Detection and Ranging) or LED-based systems. It operates by emitting a beam of light or laser pulses vertically into the atmosphere and measuring the time it takes for the light to be reflected back from cloud layers or other atmospheric particles, providing accurate and continuous data on cloud base altitude, vertical visibility, and sometimes additional atmospheric parameters. These devices are essential for meteorological observations, aviation safety, climate research, and environmental monitoring, offering automated, real-time measurements that are critical for weather forecasting, airport operations, and understanding atmospheric conditions.

The global Cloud Height Ceilometer market size was estimated at USD 125.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.45% during the forecast period.
