Abstracts

A cloud threat detection platform is a tool specifically designed to monitor, analyze, and protect against security threats in cloud computing environments. It identifies potential cyberattacks, malicious activities, and anomalous behaviors through technologies such as real-time data stream monitoring, user behavior analysis, and log collection. The platform can proactively or passively detect threats and provides automated response, threat intelligence integration, and auditing capabilities to help enterprises effectively address complex cloud security challenges and ensure the integrity and security of their cloud environments. The downstream customers of cloud threat detection platforms are primarily organizations with high information security requirements, such as enterprise information security management departments, financial institutions, internet companies, government agencies, and healthcare and energy companies. These platforms provide services such as real-time threat monitoring, intrusion detection, anomalous behavior analysis, risk warnings, and response and handling. These platforms typically generate revenue through SaaS subscriptions, pay-per-event billing, or customized deployment models. Their software and cloud service attributes result in high gross margins, generally reaching around 63%. Cloud threat detection platforms are crucial in the security architecture of modern enterprises. With the widespread use of cloud computing, traditional network security strategies have been unable to cope with the complex and ever-changing cloud environment. Cloud threat detection platforms can more efficiently respond to dynamic threats in the cloud through real-time monitoring and automated response. However, in the face of evolving cyber attack methods, relying solely on threat detection is not enough. Enterprises also need to combine strong security strategies and continuous security awareness training to achieve true cloud environment protection. In addition, the platform's scalability and compatibility across multi-cloud environments are also factors that enterprises need to consider when making choices.

The global Cloud Threat Detection Platform market size was estimated at USD 2003.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.30% during the forecast period.
