Report Overview:

CMP Membrane is a key part attached on the back of semiconductor wafer inside CMP (Chemical mechanical polishing) device to absorb semiconductor wafer in the semiconductor wafer polishing process. As membrane contacts semiconductor wafer directly, it has no surface scratch, foreign substance, bubble and other defect at all. For its direct relationship with polishing, membrane thickness should be maintained constantly within ± 0.1 mm difference.

Membrane types are differentiated according to each CMP equipment head and produced in two different sizes of 200mm and 300mm. The 300mm size is used mostly in line with semiconductor development towards high-integration and yield enhancement. The 200mm size is produced with two materials of EPDM and silicon. The 300mm is made of the silicon material.

The Global CMP Membranes Market Size was estimated at USD 201.43 million in 2023 and is projected to reach USD 317.87 million by 2029, exhibiting a CAGR of 7.90% during the forecast period.
